rigino-07). Claimed, newly identified polynucleotides (T79321-30)
cencoding esterases (W23069-77, W23088) were recovered from genomic
gene libraries. They can be used for recombinant production of the
cenzymes in host cells, and as probes to identify related sequences.
The esterases are stable at high temperature and in organic
solvents, making them superior for use in production of pure chiral
compounds used in pharmaceutical, agricultural and other chemical
industries. A method is claimed for transferring an amino group
from an amino acid to an alpha-keto acid using a claimed esterase.
The enzymes may also be useful as ripening starters in cheese making,
in lignin removal in paper and pulp manufacture, in carbohydrate
derivative synthesis, in fermentable sugar production from
lignocellulosic waste, in the study of plant wall structure, plant
resistance to disease and organic matter decomposition and to select
plants bred for production of highly degradable animal feeds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
This DNA sequence codes for thermostable esterase VF5-23LC (M23074) of Aquifex VF5, a marine strictly chemolithoautotrophic knall gas bacterium that grows optimally at 85 deg C and pH 6.8. It can be amplified from a pBluescript vector by PCR (see T79312-13). Claimed, newly identified polynucleotides (T79321-30) encoding esterases (W23069-77, W23089) were recovered from genomic libraries. They can be used for recombinant production of the enzymes in host cells, and as probes to identify related sequences. The esterases are stable at high temperature and in organic solvents, making them superior for use in production of pure chiral compounds used in pharmaceutical, agricultural and other chemical industries. A pharmaceutical, agricultural and other chemical industries. A method is claimed for transferring an amino group from an amino acid to an alpha-keto acid using a claimed esterase. The enzymes may also be useful as ripening starters in cheese making, in lignin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            T79327;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleotide sequences Z11972-Z12358 represent open reading frames (ORFs) of Neisseria meningitidis and N. gonorrhoeae which encode antigenic proteins (see Y38499-Y38944). The antigenic proteins, their fragments, their nucleic acids and antibodies are used for diagnosis, prevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragments of the nucleic acids are useful
                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Proteins from Neisseria meningitidis and N. gonorrhoeae diagnosis, treatment and prevention of infection

                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleotide sequences z11972-z12358 represent open reading frames (ORFs) of Neisseria meningitidis and N. gonorrhoeae which encode antigenic proteins (see Y38499-y38944). The antigenic proteins fragments, their nucleic acids and antibodies are used for diagnorevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related Fragments of the nucleic acids are useful
                                                                                                                                                                                                                                                                                                                                                                                        Sequence 903

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences, A81453 to A82414 represent specifically claimed Neisseria meningitidis genomic DNA sequences; A8126 to A81303 and B25620 to B25663 represent Neisseria DNA sequences and their corresponding proteins; A81254 to A81259 and A81304 to A81321 represent PCR primers used in the isolation of Neisseria meningitidis MenB sequences; and A81322 to A81452 represent Neisseria meningitidis MenB polynucleotide ORF sequences, which are all used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition. The composition can be used as a medicament (or in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  manufacture of a medicament) for treating, preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococcus B; against all serotypes; and/or against all pathogenic Neissariae. Identification of sequences from the bacterium will also facilitate production of biological probes, particularly sequences facilitate production of make efficacious Meningococcus B vaccines have failed mainly due to antigen tolerance. Multivalent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more

                                                                                                                                                                                                                                                         Db 153800 GCAGTGGTCGGTTTGGCACTCGGTGGCGGCGCATCTAAAGGATTTGCCCCATGTAGGTATT 153741
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes the full length genome of CC Nelsseria meningitidis B (NMB). The sequences in F21544 and F21607 to CC F21613 represent fragments of the NMB genomic sequence, as the sequence CC was too long to go in a record on its own it was split into 8 sequences CC which overlap each other at the beginning and end of each sequence by 4980 bp (i.e. the last 49980 bp of F21544 is repeated at the beginning CC of F21607, the last 49980 bp of F21547 are repeated at the beginning of F21608, and so on). F21545 to F21588 encode the Nelsseria proteins given CC in B58550 to B58593, and F21589 to F21606 represent PCR primers which CC are used in the exemplification of the present invention. The NMB genome CC and fragments from it have antibacterial activity, and can be used in CC cantibodies which binds to the proteins can be used in compositions for CC treating or preventing infection due to Neisserial bacteria or as a CC diagnostic reagent for detecting the presence of Neisserial bacteria or of antibodies raised to Neisserial bacteria. Computer memory, CC computer storage medium or computer databases can be used in a search to identify open reading frames (ORFs) or coding sequences within the NMB genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins which are more effective in vaccines
                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ş
                                                                                                 The present invention describes methods of obtaining immunogenic CC proteins from Neisseria genomic sequences. A8143 to A82414 represent CC specifically claimed Neisseria meningitidis genomic DNA sequences; A81260 CC to A81303 and B25620 to B2563 represent Neisseria DNA sequences and CC represent PCR primers used in the isolation of Neisseria meningitidis DNA Sequences and A81322 to A81452 represent Neisseria meningitidis DNA CC sequences; and A81322 to A81452 represent Neisseria meningitidis DNA CC polynucleotide ORF sequences, which are all used in the exemplification CC of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a CC composition. The composition can be used as a medicament (or in the CC manufacture of a medicament) for treating, preventing or diagnosing CC infection due to Neisserial bacteria. For example, some of the identified CC proteins could be components of vaccines against Meningococcus B; against CC all serotypes; and/or against all pathogenic Neissariae. Identification CC sequences from the bacterium will also facilitate production of Diological probes, particularly organism-specific probes. Attempts to make efficacious Meningococcus B vaccines have failed mainly due to CC make efficacious Meningococcus B vaccines have failed mainly due to CC make efficacious meningococcus B vaccines have failed mainly due to CC make efficacious meningococcus B vaccines have failed mainly due to CC make efficacious meningococcus B vaccines have failed mainly due to CC make efficacious meningococcus B vaccines have failed mainly due to CC make efficacious meningococcus B vaccines have failed mainly due to CC make efficacious meningococcus B vaccines have failed mainly due to CC make efficacious meningococcus B vaccines have also been tried but none
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 153380

New nucleic acid encoding polyketide-like synthesis enzymes of Vibrio marinus – and transformed plants and microbes that produced polyunsaturated fatty acids, useful as pharmaceuticals and foo

Example 1; Fig 5; 153pp; English.

generate transgenic plants that can express transgenes encoding PRS-like genes associated with PUFA production. The PRS-like genes are used to transform plants and microbial cells to give recombinants having altered contents of PUFA (specifically DHA and EPA). Oils from these plants are useful as dietary supplements (in infant feeeding formulations, to give a PUFA profile closer to that of human milk; for treating malnutrition; in intravenous feeding formulations; in cooking oils, fats etc.), also as anti-inflammatory agents and for reducing cholesterol levels. Fragments from the genes are useful as probes to isolate related molecules or to detect organisms that express PKS-like genes. The method facilitates large scale production of PUFA by providing new pathways for their synthesis or suppressing interfering pathways. Expression of PUFA in seeds allows simple recovery, as oil which can be engineered to have a marticular purp profile. particular PUFA profile. Expression in microbes also allows simple recovery and control of PUFA profile and is not subject to external variables such as weather or food supply. The present sequence represents an approximately 40 kb PKS-like cluster DNA fragment from V. marinus comprising open reading frames (ORFs) 6, 7, 8 and 9. The invention provides polyketide-like synthesis (PKS)-like genes that are used for the production of long chain poly-unsaturated fatty acid (PUFA) productions. Genes responsible for elcosapentenoic acid (EPA) production in Shewanella putrefaciens and novel genes associated with the production of docosahexanoic acid (DHA) in Vibrio marinus are used to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                14877
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            14997 atgtaaa 15003
                             normal use the recipient receives a desired amount of poly-unsaturated long chain fatty acids. The nucleic acids are also useful in large scale production of docosahexenoic acid and elcosapentenoic acid, and for the modification of the fatty acid profile of host cells and edible plant tissues and/or plant parts. Transgenic production of polyunsaturated fatty acids in particular host cells allows quicker purification from
                                                                                                                                            This invention describes novel DNA sequences encoding for polyketide (PK)-like synthesis (PKS-like) pathway genes from Shewanella, Vibrio and Schizochtrium. The nucleic acids are useful for isolating related molecules or in methods to detect organisms expressing the PKS-like genes. They are also useful for creating transgenic plants that express poly-unsaturated long chain fatty acids. The poly-unsaturated long chain fatty acids produced recombinantly are useful as dietary supplements for patients undergoing intravenous feeding or for preventing or treating malnutrition. The poly-unsaturated long chain fatty acids can also be incorporated into cooking oils, fats of margarine formulated so that in
                                                                                                                                                                                                                                                                                                                                                                                                                    New DNA sequences encoding for polyketide (PK)-like synthesis pathway genes from Shewanella, Vibrio and Schizochtrium, useful for creating transgenic plants that express poly-unsaturated long chain fatty acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PKS pathway; polyunsaturated long chain fatty acid; plant; transgenic; polyketide-like synthesis; PUFA; dietary supplement; intravenous feedi mainutrition; cooking oil; cooking fat; wargarine; docosahexenoic acid production; eicosapentenoic acid production; ds.

                     (ORPs) of Neisseria meningitidis and N. gonorrhoeae which encode antigenic proteins (see Y38499-Y38944). The antigenic proteins, their fragments, their nucleic acids and antibodies are used for diagnosis, prevention (as vaccines) or treatment of Neisseria infections,
                                                                                                                                                                                                                                                                                                                                                                                   Grandi G,

specifically claimed Neisseria meningitidis genomic DNA sequences; A81260 to A81303 and B35620 to B25663 represent Neisseria DNA sequences and their corresponding proteins; A81254 to A81259 and A81304 to A81321 represent PCR primers used in the isolation of Neisseria meningitidis DNA sequences; and A81322 to A81452 represent Neisseria meningitidis MenB polynucleotide ORF sequences, which are all used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition. The composition can be used as a medicament (or in the

Identification of sequences from the bacterium will also facilitate production of biological probes, particularly organism-specific probes. Attempts to make efficacious Meningococcus B vaccines have failed mainly due to antigen tolerance. Multivalent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more

POXC, POXD, POXE, POXF, POXG, POXH and POXI. The proteins at the fields of petroleum purification, chemical industry and industry related to the synthesis, conversion and decomposit

The present sequence encodes Alcaligenes sp. proteins PoxR, PoxA, PoxPoxC, PoxD, PoxE, PoxF, PoxG, PoxH and PoxI. The proteins are useful

encoding an aromatic cpd. oxidative decompsn. efficids of petroleum purification, chemical and

enzyme drug
